Model CS1PH1-2HP 240 VAC Troubleshoot

<u>Please Note: To view a fault on the Cycle Sensor display, you must be able to see</u> <u>the Sensor display before turning off the power to the panel. Fault display is lost</u> <u>once the power has been turned off.</u>

Fault Displayed Remedy 1: DRY - the pump has been shut down on under-Push the reset button on the Cycle Sensor or load. turn power to the unit off and back on. If pump goes off on DRY again, it could indicate that you need to reset your under-load setting or that your pump is actually running dry. Push the reset button on the Cycle Sensor or 2: **RCYC** - the pump has been shut down because turn power to the unit off and back on. of rapid cycling. If pump goes off on RCYC again, it may indicate that you need to reduce the rapid cycle timer or the problem that caused the rapid cycling. (i.e. bad check valve, control valve malfunction, improperly sized tank or waterlogged tank, or improper pressure switch settings or chattering contacts caused by incorrect placement of the PS in system) Correct problem before the pump is allowed to run on automatic again. Make sure the pressure switch or other pump control is calling for the pump to run. You may 3: 000 - the pump has power but is not running. need to release water from the tank to decrease the pressure to make the pressure switch energize the pump. If the pump fails to start, check pump overloads and wire connections. 4. Numbers other than 000 in display - when This is not a fault. the pump is running and this is an indication of the amp draw. If the pump is not running, it is picking up stray voltage. It does not go to zero. 5. No display - the Cycle Sensor or the pump Check incoming power supply to motor and Sensor. have lost power or has shorted out. Unlock adjustment settings by holding the up and 6. Sensor will not adjust.

down button at the same time.
